

PILOT PROTOTYPE · PLAYER-SIDE DAILY LOOP

THE INFECTION GAME

Working Prototype · How to Use

A working slice of the player-side daily loop, built to make the campaign mechanic tangible. Two phones, one cell, and the seven-day decision rhythm the proposal describes — running live, on real devices.

01 · HOW TO USE IT

Five steps, two phones.

- 01 **Open the link on your phone**

Visit `infection-drop-demo.vercel.app` in any mobile browser. No app, no account.
- 02 **Choose your initial**

One letter. The cell sees you only by this letter. For two-phone demos, pick different letters.
- 03 **Enter the cell code**

Both phones type the **same code**. Anything works — *NCADA*, *SCAPE*, the date. Same code, same cell.
- 04 **Read the story, make the choice**

Each day opens with a pressure scenario. **HOLD** stays with the cell. **RELEASE** claims a solo advantage.
- 05 **Advance the days**

Tap **Advance Day** to move forward. Seven days total. After Day 7 the cell lands on **The Reckoning**.

02 · WHAT YOU WILL SEE

Five things to notice.

- 01 **The story changes the room**

Each day opens with a scenario — a friend asking, a phone buzzing. The decision lands inside a story, not a survey.
- 02 **Decisions appear instantly on both phones**

The other phone updates within a fraction of a second. The same technical foundation the live campaign will use.
- 03 **The infection meter moves with the cell**

More **HOLDS** push the meter down. More **RELEASES** push it up. The cell is the unit; individual choices feed a collective state.
- 04 **Member pills tell the social story**

Filled red = held. Grey = released. Faded = not yet decided. The cell's social state, at a glance.
- 05 **The Reckoning closes the week**

Day 7 closes with a reflection. In the full campaign, this is the live broadcast moment at **SCAPE Somerset*.

03 · PRODUCTION ROADMAP

What the pilot delivers on top of this.

The prototype is the player-side daily loop. The full pilot build extends this foundation across the campaign architecture described in the proposal.

PRODUCTION AUTHENTICATION

Phone-OTP sign-in with PDPA-aligned consent capture, replacing the demo's open-access cell-code model. Verified players, retained consent records.

CONTENT MODERATION

AI moderation layered with human review across all participant-generated content. Sensitive-content escalation and final-decision authority retained under human judgement.

THE CONFESSIONAL

Static voice station across all six street days. Anonymous voice capture with modulation, moderation queue ingestion, and content flow into the Saturday broadcast.

RECKONING VOTE INFRASTRUCTURE

The single anchoring vote moment under live audience load. Every phone and every online viewer responding simultaneously with instant aggregation and broadcast-ready graphics.

THE CONVERSATION INTERFACE

Closing-act stage flow. NCADA's airtime, structured exit pathways, support-resource handoff and post-event survey capture aligned to the HIGH-informed framework.

STREET LAYER & REPORTING

Plaza interactive integration at **SCAPE Somerset*, sub-200ms input-to-display latency, daily ops dashboards, nightly digests and the final NCADA-ready report.

A NOTE ON THIS PROTOTYPE

A working prototype, not a production system. Content is illustrative, moderation is intentionally absent, and access is open by cell code rather than verified identity. Treat it as a proof of mechanic. The pilot's full production scope is in the proposal.
